

Integrative Essentials: Pre-Treatment

SANFORD[®]
HEALTH

Welcome to Integrative Essentials: Pre-Treatment. As you begin treatment, your medical team will support you throughout and you can learn skills to be an active participant in your healing process. In this program, you will learn to relax and imagine your own healing which can help you thrive through treatment.

Treatment will look different for everyone. Surgery, chemotherapy (chemo) or radiation may be used alone or together.

You can begin to:

- Understand the effect stress has on the body and mind
- Explore why you want to get better
- Discover what healing looks like for you
- Create a strategy to communicate with your medical team
- Learn tools to help reduce stress

Understand Stress

This program will assist you with tools to deal with stress as you go through cancer treatment and beyond. Being diagnosed with cancer is stressful so a major goal of this program is to learn how to manage those stressors. Stress is the perception of a threat to your physical or psychological well-being and the belief you do not have the skills to manage. What that means is:

- Your body or mind decide that something dangerous is happening or is about to happen to you.
- Your body or mind think you do not have the tools or the tools you have are not strong enough to stop the danger.

During stress, the sympathetic nervous system (SNS) kicks into gear. Perhaps you have heard fight or flight used to describe how the SNS works. During a stress response, the fight or flight system is engaged, hormones are released into the body and the body is given extra energy to run away or to stay and fight. This response has kept humanity safe for thousands of years. To keep the human race going, we needed to remember that a saber tooth tiger would bite if we let it get too close.

Today, stress responses are helpful to boost reflexes during a car accident, alert us during public speaking, or catch a toddler as they leap off a table. Short bursts of these stress hormones are also good to strengthen your immune system (Dhabhar, 2014). However, it is not helpful to live in chronic stress. When our ancestors ran away from a saber tooth tiger thousands of years ago the SNS gave them enough energy to run away, climb a tree, and let the threat pass. After the short burst of energy from the stress response they went back to living a simple life. These were necessary and helpful short bursts of stress. Unfortunately, most modern humans live in a state of **chronic** stress.

Whether it is busy schedules, the 24-hour news cycle, or the demand to achieve, our culture promotes a state of chronic stress. When the body is chronically stressed, it is like an over-worked engine. The systems of the body stay in high levels of stress for long periods of time and your engine control system cannot keep up. It becomes depleted, is forced to run on fumes and then no longer has the energy to keep the body healthy and working well. Research confirms long-term stress has a negative impact on the body (Salleh, 2008).

Because of this negative impact, it is important to take time to reduce stress, especially when you are about to begin treatment for cancer. Your body and mind need the time to shift into the relaxation response known as the parasympathetic nervous system (PNS.) That is where your natural healing abilities are activated, which can work with your treatment to get rid of any abnormal cells.

Things you hear about treatment can increase the stress response. Stories from friends or family members, on-line research, or support group chat rooms can focus on the negative aspects of treatment. Positive treatment stories are usually not shared or, if they are, not what the mind remembers.

Remember, your brain is set up to recall threats in order to survive. Your mind holds on to the negative (which your brain views as a threat) while dismissing the positive (Hanson, 2014). It draws conclusions using the negative information before you even have the experience! In order to have a helpful, uplifting outlook on your treatment, you must practice just that. If you do not give the mind a chance to realize your treatment can go well and you can feel comfortable and thrive, then the mind may think only negative outcomes are possible.

The quality of our thoughts are interwoven with our emotions and behaviors.

You did not have any control over being told you have cancer, but you do have a choice of how you go through this process. You can choose to take steps to reduce your stress. You can choose to think uplifting thoughts and see your treatment as helpful. You can choose to honor feelings as they come up and utilize the tools you have to help them shift. You did not choose to have cancer, but you **can** choose to take part in your healing process.

Partnering With Your Medical Team

Creating a partnership with your medical team goes a long way in feeling a sense of care and safety during treatment. In fact, your outcomes and symptoms can be improved greatly if there is a sense of mutual respect. It is helpful to know that your team is listening to your wants and needs.

(Chandra et al., 2018).

Do you feel you and your team are working well together? Do you feel encouraged to discuss your treatment? If it is important to you to be a part of decision making, do you feel included?

To begin answering these questions, it is helpful to have an understanding of what type of role you would like to take in the decision-making. What type of role would you like to play throughout your treatment? Are you a person who likes to have **all** the information about your treatment in order to make the best decisions for you? Or does hearing all of the details create more stress and anxiety?

If you are a person who wants all of the information:

- Write down all of the questions you want ask your doctor.
- Have a notebook for your questions or put notes in your phone
 - Bring to your medical team and do not be afraid to ask!
- If possible, bring a support person to be your “second set of ears” or ask if it is ok to record your appointment so you can refer back to the information given.

If you find that you are **not** someone who likes to hear all treatment details, you could ask a family member or friend who you trust to get the details you do need.

Whether or not you like hearing in-depth information about your treatment, your medical team **must** tell you about side effects or problems that could occur during surgery, chemotherapy or radiation. Hearing these side effects are helpful to some, but can create more anxiety and fear for others. Listen to what your medical team needs to communicate and then ask “Will you please share with me the benefits of having this procedure or treatment?” You can choose what information helps boost your confidence and set aside information that might cause stress.

Think About What Healing Means to You

Concepts such as “getting better”, “experiencing healing” and “being well” mean different things for different people. It can, but does not have to mean “cured”. It is how you describe thriving through treatment and the rest of your life.

What might “better”, “healing”, “wellness” look or feel like to you? Go to your Integrative Essentials worksheet to write your ideas.

It can be helpful to know why you want to get better. This may seem silly at first. But how would you answer? Why do you want to get better? Yes, the easy answer might be “to live” or “to be healthy”, but why do you want to live or be healthy? To spend more time with your friends or family? To be able to do your favorite hobbies? To do the work you were called to do? What makes those things important to you? Write these on your Integrative Essentials worksheet.

Wellness is different for everyone. Understanding what it looks like for you and why it is important can be helpful to know as you go through treatment.

Integrative Essentials: Pre-Treatment Tools

The Integrative Essentials steps for being an active participant in your treatment are:

1. Spend time in relaxation by listening to the calming relaxation track
2. Allow people to support you with uplifting intentions.
3. Prepare intentional messages for your treatment.

Step 1: Listen to the Calming Relaxation Practice

The first step is to take time for intentional relaxation and healing images every day. You will be given an audio of a relaxation practice made as part of the integrative essentials program.

For surgery:

- Begin practicing now, once per day
- 3-7 days before your surgery, practice 2 times per day

For chemo or radiation:

- Listen to this track once per day
- Listen 2 times a day if you are having extra anxiety, stress, or worry.

Your caregivers are anyone who supports you throughout treatment. A caregiver may be a spouse, parent, sibling, your children, or friends. Ask them to help remind you to carve out time to listen to your relaxation track. You might even ask them to join you in listening! It can be helpful to have them imagine your treatment going well, too. A Caregiver Support relaxation track is also available.

Studies show that taking time to relax can help boost the immune system, reduce nausea and help manage pain (Huddleston, 2013). Relaxation is what your body and mind need to switch from that fight-or-flight and into the relaxation nervous system. Remember, the relaxation portion of your nervous system is where your body has the opportunity to rest, rejuvenate and to activate the natural healing abilities you naturally possess. The provided audio is to give you an intentionally guided practice. In this guided practice, you will use body awareness, spend time in your healing place, tap in to an “inner strength”, personalize healing images, and practice gratitude.

Much of this relaxation practice asks you to use your imagination. Children use their imagination all the time, but are often not encouraged to continue as they grow. Your imagination is still there. It is like a muscle to be strengthened.

Everyone imagines in a different way. If you have any prior experience with guided practices such as these, you might have heard the use of the word visualize. This word visualize can sometimes be frustrating because not everyone can visualize. But everyone **can** imagine. Observe how you imagine. Is it:

- Visual
- Do you hear sounds
- Feel sensations
- Have an inner knowing
- Hold the concepts in your mind

Close your eyes and think of a red fire truck. Do you see the fire truck? If you do not see it do you hold the idea of a firetruck in your mind? You know that it is red, has at least four tires, lights may be flashing, there is a loud siren, and ladders and hoses attached. See? You can imagine the fire truck in your mind!

Anyone can do this relaxation practice. No experience required! Just close your eyes and listen. You do not have to work hard at trying to feel a certain way- whatever happens, happens. Simply mindfully observe it.

Body Awareness

You begin by bringing your awareness through your body, and you do this by simply listening to the audio and following along. You will be guided to allow a sense of comfort to travel through your body. Everyone experiences “comfort” differently. For you, it might be relaxation or calm. You might experience a heavy or light feeling, or be filled with a color that represents comfort. Again, there is no wrong way to do this- just listen and notice what happens.

Healing Place

Next, you will be prompted to imagine yourself in a comfortable, safe and healing place. This might be a place you know very well, or a place you know of (Rossman, 2003). It might be a brand new place you have never been to before. It does not matter, as long as this place feels safe to you and has a healing quality to it. You might know exactly what is healing about it, but you might not.

Go to your Integrative Essentials worksheet to take some notes about your place, but know that what comes to you when you listen to the relaxation track might be different from what you originally write down. Trust that your mind will take you to exactly where you need to be. When you are there, use all of your senses to create a full picture for your mind. When you are in this place, even if it is familiar, notice the things you see, hear, smell, and feel. Notice how safe and comfortable you feel in this place.

Tap in to an “Inner Strength”

Inner strengths might also be referred to as positive emotions. We know that experiencing emotions or thoughts that are uplifting can create a sense of well-being, resilience and connection. What inner strength would you like to create? What would be most helpful now? You might not feel like you embody this inner strength at the moment, but you want more of it as you go through treatment. Maybe you have experienced it in the past. Perhaps you know you have this inner strength right now, but you want to feel even more of it. In any case, we all have these strengths within us, we just need to remember that they are there and allow it to activate within!

Choose what inner strength you would like to cultivate within you during your treatment. There's no need to over think it. Just choose which one feels best to you and write it on your Integrative Essentials worksheet. Here are some ideas:

- Joy
- Gratitude
- Serenity
- Interest
- Hope
- Pride
- Amusement
- Inspiration
- Awe
- Love
- Contentment
- Other

Once you have chosen your inner strength, write about a moment where you have had that strength or would represent that you are living it now. There is space on your Integrative Essentials worksheet to make these notes.

Your Healing Images

The next step is to spend some time imagining that your treatment is going and has gone very well. These images will vary depending on your type of treatment. You will even be able to personalize some of these images because the words and moments that you provide will be the most effective! When you imagine your treatment going well, you are giving your mind the opportunity to understand that thriving through treatment is a very attainable goal.

For surgery:

- You will be guided through an image that your expert medical team is well rested, ready to do wonderful work for you, and that your surgery has gone very well. Simply listen to the audio and follow along.

For chemo and radiation:

- Create an image that shows treatment is healing for you and doing exactly what it should. The image may take place in the treatment room or somewhere else. You will choose what is important to you. As you use all of your senses to create this image, you will also continue to be filled with your inner strength. You might even imagine talking to a loved one (or thinking to yourself) to express how great you feel and/or how well your treatment is going.

An Image for Everyone:

Create a moment that represents you are completely healed from treatment. Look to the future, as far out as you would like to look. Imagine that you are doing something you love to do that is calming or relaxing. Or perhaps choose to imagine yourself doing something that is energizing, exciting and meaningful or something you are looking forward to. Throughout this moment, you are sensing your inner strength.

Gratitude

Your session ends with a moment of gratitude. According to Harvard Medical School, experiencing gratitude:

- Makes it easy to recognize a good experience
- Cultivates resilience
- Supports respectful relationships
- Makes you happier

This is a time to create a sense of kindness and compassion for your medical team, treatment, and your body. Feeling kindness, compassion and gratitude aids in overall wellbeing.

It might be easy to understand being grateful for your medical team and even your treatment. But have gratitude for your body? This is a foreign concept to many. After a cancer diagnosis and during treatment, it can feel even more challenging. It's understandable to feel this way, but think of this: You ask someone to do something for you, but instead of saying thank you and giving praise for the effort they put forward, you tell them they are awful, horrible, that you want them to be any other way than the way they are. Would you ever treat someone that way? Do you find yourself talking to your body that way? Having a nurturing and caring relationship with your body is good for your overall wellbeing.

Step 2: Allow People to Support You

In Integrative Essentials: Pre-Treatment, you will ask people to think of you the day of treatment. You may ask for uplifting intentions such as:

- Prayers
- Positive thoughts
- Healing energy
- Bright white light
- Other

There is evidence that people who know others are sending them positive thoughts get better faster and have fewer complications (ScienceDaily, 2007). Record the uplifting intentions you would like to receive in the Integrative Essentials: Pre-Treatment worksheet.

Ask your family, friends, co-workers, church groups, club members, fishing buddies, book club members, and others to think of you. Some people prefer to keep their treatment private. In that case, perhaps ask family or a few close friends to help you with this step. You may be surprised how many people would be willing to help you in this way.

There are many ways you can create your support team. You could call or text people directly. Or send an email or post a message on your CaringBridge site if you have one. You might make a private Facebook group and invite people who you think would be open to thinking of you the day of your treatment.

If you are preparing for surgery, ask them to send you these thoughts early in the morning before your surgery begins, if possible. You most likely do not know the time your surgery will begin as of yet, but you can simply ask your support group to send you the thoughts bright and early. Your chemo or radiation start times might change, so you might decide to simply share the date with your group and ask for uplifting intentions any time that day.

If organizing this support group feels too overwhelming, ask someone to help you. They can share the type of intentions you would like to receive along with the dates and times of your treatment.

Step 3: Intentional Messages

Many people about to begin treatment for cancer experience thoughts of fear or worry. This is normal. Crafting and using intentional messages can be one way to bring yourself from a state of fear and worry to a state of calm and relaxation.

Your mind is always taking in messages. In times of stress the mind is very open and can be easily swayed. Chronic long-lasting negative thoughts will lead you to see the world in a negative light. But you can start to change the script by bringing your thinking to a more neutral state. As you shift your thinking, your experience may become more positive (Hanson, 2014).

Again, it is very important to note that you do not need to be positive all the time. Everyone has days when they are more sad, angry, worried, or afraid. It is ok to feel these things! It is when thoughts such as “this is going to be so horrible,” “I can’t do it,” “I’m not strong enough,” or “this is poison” are allowed for a prolonged period of time that problems result. Thinking these thoughts over and over again, especially when there is extra stress, makes the brain believe it is true and that it is the only truth that exists. Would you say those types of things to a friend or family member when they were under stress? No, you would not!

A tool that can be used to help flip that negative script are intentional messages. When negative thoughts fill your mind about treatment, you will learn to lean on more positive thoughts. If you are preparing for surgery, these intentional messages will be read to you as you are under anesthesia. If you are preparing for chemo or radiation, you will use these intentional messages in moments of worry, fear, or stress.

Intentional Messages for Surgery

During surgery, although you are not conscious or aware of what is happening, general anesthesia does not block out the part of your brain that hears. Therefore, it is important that what is said around you is as helpful and supportive as possible (Rosendahl et al., 2016). Hearing intentional statements at the beginning and end of your surgery is very effective. By working with your medical team, you can use these statements to create a helpful mindset.

When you arrive at the hospital on the day of your surgery, bring along your “Intentional Messages for My Medical Team” pages. Give a page to your surgeon when they come in to see you before surgery begins. Keep an extra copy for yourself. Anyone can read these statements to you during your surgery. It might be your surgeon, anesthesiologist, nurse, or nursing assistant who reads it to you- it does not matter.

As you are going under anesthesia, someone from your medical team will say:

We are here taking care of you. Let yourself be in your safe, healing place. After surgery you will be comfortable and you will notice your healing has already begun. We are here taking care of you.”

Toward the end of surgery they will say:

““

Your surgery has gone very well.

““

All of your body systems are strong.

““

Your digestive system is working exactly as it should.

They will also read to you an intentional message you create. When creating your personalized message, consider these questions: How would you like to feel after your surgery? What goals do you have following your surgery? Is there a short prayer you would like to hear? Use some of your answers to write your own intentional message.

You can use this intentional message in moments you experience worry or fear. Please create your intentional message on your “Intentional Message Guide for My Team” page.

Intentional Messages for Chemo or Radiation:

When you use intentional messages for chemo or radiation, say them to yourself every day, especially when you feel any stress, worry, or fear about your treatment. They can be repeated out loud, silently, or you could write them down. Everything about these statements should be **uplifting, positive, or neutral**, and write them as though they are happening **right now**. Remember, focusing on positive or neutral thoughts and statements can have a greater impact on your body and overall well-being. Feel free to use just one or all of the prompts below. You might consider writing these statements and placing them somewhere you can see them every day.

You can share this information with your family and medical team (especially your medical team with you in your infusion room or in radiation). How would you like others to refer to your treatment? What kind of environment would you like them to help you to create in regards to your treatment? The messages you hear about and during your treatment can affect your experience, so share these intentional messages with those around you.

Intentional Messages for chemo or radiation:

To begin, do 2 to 5 rounds of square breathing (found later in this guide). Then say or write:

I have chosen this treatment to:

- Help
- Nurture
- Heal
- Other: _____

I am _____ (write how you want to feel)

Write any other goals as an intentional statement. Fill in your messages on your Integrative Essentials worksheet.

Congratulations, you have taken helpful steps to prepare yourself to spend time in relaxation and be an active participant in your treatment! You will:

- Listen to the relaxation track, using your healing images. Listen at least 1 time each day, 2 times if you are having a particularly stressful, worried or anxious day, or if you are about 3-7 days away from surgery. The more you do this practice, the easier it will be to activate the relaxation response!
- Ask a group of people to send you uplifting intentions the day(s) of your treatment(s).
- Prepare and use your intentional messages. If having surgery, place your Intentional Message Guide for My Medical Team sheets in a place where you will remember to bring them the day of your surgery. If preparing for chemo or radiation, the more you repeat your intentional messages, the better!

You now have many tools to utilize to promote healing and wellness within your body and mind. Use these tools every day to be an active participant in your treatment. Your body, mind and spirit will thank you!

Other Tools for Your Stress-Reduction Toolbox:

- Square breathing
- Exercise
- Sleep hygiene

Square Breathing

Breathing can have a great effect on the mind. The breath not only acts as an anchor to the present moment, but can also help you create focus, energy, or calm. It can help give space between you and unhelpful thoughts. One easy breathing practice is called square breathing. Square breathing can help create calm and balance in the mind, help you get to sleep, and reduce treatment symptoms. Use this breathing practice before you state your intentional messages for chemotherapy or radiation or any time you feel stress, worry or anxiety.

To practice square breathing:

- Inhale
- Pause your breath
- Exhale
- Pause your breath

Count the length of each step in order to keep them equal. For example, silently count to four as you inhale, count to four as you pause your breath, count to four as you exhale, count to four as you pause your breath. You can choose any number, just keep the count even. Practice 2 to 10 rounds or set a timer and practice for 1 to 5 minutes, as often as you need.

<https://youtu.be/AQIHFD-K4ak>

Watch an instructional video about square breathing by typing in the YouTube link into your search bar, or you can hold the camera on your smartphone or tablet up to the QR code to be taken directly to the link.

Exercise

Exercise is a great way to prepare your body for treatment, manage symptoms (particularly reduce fatigue), maintain strength and functional mobility, and assist in balancing mental health. If you are new to exercise and are currently in or have just concluded treatment, start out by exercising lightly. Suggested activities include walking, using a stationary bike, light weight lifting, yoga, or other body weight exercises. Always ask your doctor for exercise recommendations and restrictions, but here are some general guidelines:

Surgery:

Enhanced Recovery after Surgery (ERAS) provides a guideline for best outcomes after surgery. It is advised to be active for at least 30 minutes per day, for at least 5 days before surgery if you are able. Right after surgery, it is important to move your body by gently moving your legs in bed, sitting up, and even getting up to walk. Moving after surgery is one of the best ways to begin your recovery. Listen to your medical team, they will assist you with this.

When you get home after surgery, continue to be gently active but be sure to follow your doctor's guidelines. For example, you may be given a limit of what you can lift such as no more than 10 pounds for at least 6 weeks after surgery. This is a great time to walk and do exercises you may have been given by physical therapy.

Chemotherapy or Radiation:

According to the American College of Sports Medicine, it is recommended to build up to 150 minutes of exercise per week while in treatment.

If you have already been exercising before your diagnosis, continue doing so but listen to your body. There may be some days you need to do a gentler form of movement. Continue to adhere to any lifting restriction if you just had surgery and wait for your doctor's approval before you lift anything heavy.

If you did not exercise before your diagnosis, start at a place that is manageable for you. You might consider beginning a walking program or doing a gentle yoga practice for 1 to 15 minutes per day. Begin to lengthen the amount of time you are exercising as you feel ready (McTiernan et al., 2019).

Consistency is key whether you are an experienced exerciser or are just beginning. Try to move your body every day, even if it is only for a few minutes!

Sleep Hygiene

Sleep is very important for the health and wellbeing of your body and mind. During this needed rest, your body shifts into the relaxation (healing) part of your nervous system. Sleep can sometimes be disrupted due to the stress that comes along with a diagnosis, due to medication, or physical discomfort. “Sleep hygiene” is a phrase used to describe good sleep habits. Here are some sleep hygiene tips if you are having difficulty with sleep:

- Go to bed and wake up at the same time every day.
- Create a sleep routine.
- Avoid caffeine past 2 pm.
- Avoid alcohol at least 2 hours before bed.
- Do your best to avoid naps after 2 pm.
- Avoid blue light from screens before bedtime.
- Avoid a heavy meal right before bed.

Integrative Essentials Worksheet for Surgery

What might “better”, “healing”, “wellness” look or feel like to you?

Why do you want to get better? Yes, the easy answer might be “to live” or “to be healthy”, but why do you want to live or be healthy? To spend more time with your friends or family? To be able to do your favorite hobbies? To do the work you were called to do? Write why here:

-
-
-
-
-

My Relaxation Practice

My personal healing place (what would you see, hear, smell, feel in this place):

My chosen inner strength: _____

Have you experienced that inner strength in the past? Write a few notes about that moment and how you felt during it. If you have not experienced your chosen inner strength, jot down a few notes of how you would imagine you would act or be if you **did** embody it:

Create an image of yourself in the future that shows you are completely healed from surgery and you have an acceptance of that healing. Write about it here:

Allow People to Support You

The type of uplifting intentions I would like to receive on the day of my surgery are:

Integrative Essentials

Intentional Messages for My Surgery Team

Thank you for caring for me during my surgery. Please read these statements to me at the beginning of my surgery and at the end of my surgery. They are as follows:

As I Am Going Under Anesthesia, Please Say:

“We are here taking care of you. Let yourself be in your safe, healing place. After surgery you will be comfortable and you will notice your healing has already begun. We are here taking care of you.”

Toward the End of Surgery Please Say:

“Your surgery has gone very well.”

“Your digestive system is working exactly as it should.”

“All of your body systems are strong.”

“

”
